Estimation with active sensing

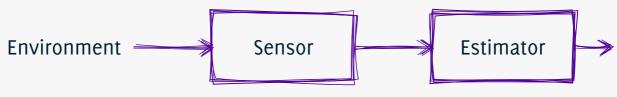

ADITYA MAHAJAN MCGILL UNIVERSITY

February 11, 2011. ITA Workshop

Sensor transmits packet to the estimator

- Each transmission incurs a constant cost
 (energy required to switch on the radio and transmit a packet).
- Trade-off estimation quality with transmission energy
- The sensor decides when and how to transmit
 (as opposed to the estimator scheduling the transmissions
 ... or the sensor communicating without coding)

Sensor transmits packet to the estimator

- Each transmission incurs a constant cost (energy required to switch on the radio and transmit a packet).
- Trade-off estimation quality with transmission energy
- The sensor decides when and how to transmit
 (as opposed to the estimator scheduling the transmissions
 ... or the sensor communicating without coding)

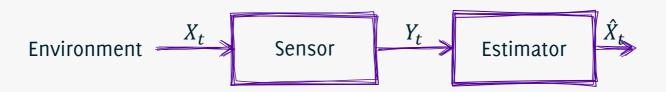

When to communicate? And how to communicate?

IHT IHT IHT II

Environment

First order Markov process $\{X_t, t = 1, 2, ...\}, X_t \in \mathbb{X}$

Environment

First order Markov process $\{X_t, t = 1, 2, ...\}, X_t \in X$

Sensor

$$Y_t = f_t(X_{1:t}, Y_{1:t-1}), \quad Y_t \in \mathbb{Y} := \mathbb{X} \cup \{\mathbb{b}\}$$

Environment

First order Markov process $\{X_t, t = 1, 2, ...\}, X_t \in \mathbb{X}$

Sensor

$$Y_t = f_t(X_{1:t}, Y_{1:t-1}), \quad Y_t \in \mathbb{Y} := \mathbb{X} \cup \{\mathbb{b}\}$$

Estimator

$$\hat{X}_t = g_t(Y_{1:t}), \quad \hat{X}_t \in \mathbb{X}$$

Environment
$$X_t$$
 Sensor Y_t Estimator \hat{X}_t

Environment

First order Markov process $\{X_t, t = 1, 2, ...\}, X_t \in \mathbb{X}$

Sensor

$$Y_t = f_t(X_{1:t}, Y_{1:t-1}), \quad Y_t \in \mathbb{Y} := \mathbb{X} \cup \{\mathbb{b}\}\$$

Estimator

$$c(y) = \begin{cases} 0, & y = \mathbb{b}, \\ c^*, & y \in \mathbb{X} \end{cases}$$

$$ightharpoonup d$$
 is a metric on X

Problem Formulation

Transmission policy and estimation policies

$$\mathbf{f} = (f_1, f_2, \dots, f_T)$$
 $\mathbf{g} = (g_1, g_2, \dots, g_T)$

Performance of a policy

$$\mathcal{J}(\boldsymbol{f}, \boldsymbol{g}) \coloneqq \mathbb{E}^{f,g} \Big[\sum_{t=1}^{T} c(Y_t) + d(X_t, \hat{X}_t) \Big]$$

 \blacksquare Causal Policies $(\mathcal{F}, \mathcal{G})$

$$\mathcal{F} = \prod_{t=1}^{T} F_t, \qquad F_t = \left(\mathbb{X}^t \times \mathbb{Y}^{t-1} \mapsto \mathbb{Y} \right)$$
$$\mathcal{G} = \prod_{t=1}^{T} G_t, \qquad G_t = \left(\mathbb{Y}^t \mapsto \mathbb{X} \right)$$

Problem Formulation

■ Transmission policy and estimation policies

$$\mathbf{f} = (f_1, f_2, \dots, f_T)$$
 $\mathbf{g} = (g_1, g_2, \dots, g_T)$

Performance of a policy

$$\mathcal{J}(\boldsymbol{f}, \boldsymbol{g}) \coloneqq \mathbb{E}^{f,g} \Big[\sum_{t=1}^{T} c(Y_t) + d(X_t, \hat{X}_t) \Big]$$

■ Causal Policies $(\mathcal{F}, \mathcal{G})$

$$\mathcal{F} = \prod_{t=1}^{T} F_t, \qquad F_t = \left(\mathbb{X}^t \times \mathbb{Y}^{t-1} \mapsto \mathbb{Y} \right)$$
$$\mathcal{G} = \prod_{t=1}^{T} G_t, \qquad G_t = \left(\mathbb{Y}^t \mapsto \mathbb{X} \right)$$

P1: Choose $(f,g) \in (\mathcal{F},\mathcal{G})$ to minimize $\mathcal{J}(f,g)$

Salient Features

Sequential dynamic team

Sensor and estimator have access to different information at different times.

Salient Features

Sequential dynamic team

Sensor and estimator have access to different information at different times.

■ Causal real-time communication

Equivalent to a real-time communication system with input cost

Huge literature on sensor sleep scheduling and sensor "censoring".

- Huge literature on sensor sleep scheduling and sensor "censoring".
- Most relevant results: Imer and Basar, 2005, Lipsa and Martins, 2007 Consider $\{X_t, t = 1, 2, ...\}$ is a Gauss-Markov process

- Huge literature on sensor sleep scheduling and sensor "censoring".
- Most relevant results: Imer and Basar, 2005, Lipsa and Martins, 2007 Consider $\{X_t, t = 1, 2, ...\}$ is a Gauss-Markov process
- Structure of optimal policy: Communicate if

 $|X_t - \text{prediction if sensor does not transmit}| \geq \tau_t$

- Huge literature on sensor sleep scheduling and sensor "censoring".
- Most relevant results: Imer and Basar, 2005, Lipsa and Martins, 2007

 Consider $\{X_t, t = 1, 2, ...\}$ is a Gauss-Markov process
- Structure of optimal policy: Communicate if $|X_t \text{prediction if sensor does not transmit}| \geq \tau_t$
- Implication: Optimal policy is easy to implement . . .
 - ... but the intuition relies of the Markov process being Gaussian.

For non-Gaussian processes, is the optimal policy easy to implement?

Solution approach

Identify irrelevant information at sensor

Fix estimator. Set up the problem at the sensor as a MDP

■ Find structure of optimal transmission and estimation policy: Coding does not improve performance

A sequence of interchange arguments

- Identify a dynamic programming decomposition
 - Dynamic team problem. Use the coordinator approach proposed by [Mahajan, Nayyar, Teneketzis, 2008]
- Simplify DP using structural result
- Implementation issues

■ Simple Causal policies $(\mathcal{F}', \mathcal{G})$

$$\mathcal{F}' = \prod_{t=1}^T F_t',$$

 \blacksquare Simple Causal policies $(\mathcal{F}',\mathcal{G})$

$$\begin{split} \mathcal{F}' &= \prod_{t=1}^T F_t', \\ F_t' &= \Big\{ f_t \in F_t : \forall x_{1:t-1}^{(1)}, x_{1:t-1}^{(2)} \in \mathbb{X}^{t-1}, \, \forall x_t \in \mathbb{X}, \, \forall y_{1:t-1} \in \mathbb{Y}, \\ &\text{we have } f_t(x_{1:t-1}^{(1)}, x_t, y_{1:t-1}) = f_t(x_{1:t-1}^{(2)}, x_t, y_{1:t-1}) \Big\}. \end{split}$$

■ Simple Causal policies $(\mathcal{F}', \mathcal{G})$

$$\begin{split} \mathcal{F}' &= \prod_{t=1}^T F_t', \\ F_t' &= \Big\{ f_t \in F_t : \forall x_{1:t-1}^{(1)}, x_{1:t-1}^{(2)} \in \mathbb{X}^{t-1}, \, \forall x_t \in \mathbb{X}, \, \forall y_{1:t-1} \in \mathbb{Y}, \\ & \text{we have } f_t(x_{1:t-1}^{(1)}, x_t, y_{1:t-1}) = f_t(x_{1:t-1}^{(2)}, x_t, y_{1:t-1}) \Big\}. \end{split}$$
 or equivalently if $f_t \in F_t'$ then $y_t = f_t(x_t, y_{1:t-1})$

■ Simple Causal policies $(\mathcal{F}', \mathcal{G})$

$$\begin{split} \mathcal{F}' &= \prod_{t=1}^T F_t', \\ F_t' &= \Big\{ f_t \in F_t : \forall x_{1:t-1}^{(1)}, x_{1:t-1}^{(2)} \in \mathbb{X}^{t-1}, \, \forall x_t \in \mathbb{X}, \, \forall y_{1:t-1} \in \mathbb{Y}, \\ & \text{we have } f_t(x_{1:t-1}^{(1)}, x_t, y_{1:t-1}) = f_t(x_{1:t-1}^{(2)}, x_t, y_{1:t-1}) \Big\}. \end{split}$$
 or equivalently if $f_t \in F_t'$ then $y_t = f_t(x_t, y_{1:t-1})$

Proposition

There is no loss of optimality in restricting attention to simple causal policies.

Fix an arbitrary estimation policy. Look at the problem of choosing the best transmission policy.

Define $Z_t = (X_t, Y_{1:t-1})$. We can show that

- $\mathbb{P}(Z_{t+1}|Z_{1:t},Y_{1:t}) = \mathbb{P}(Z_{t+1}|Z_t,Y_t)$
- $\blacksquare \mathbb{E}[c(Y_t) + d(X_t, \hat{X}_t) | Z_{1:t}, Y_{1:t}] = \mathbb{E}[c(Y_t) + d(X_t, \hat{X}_t) | Z_t, Y_t]$

Fix an arbitrary estimation policy. Look at the problem of choosing the best transmission policy.

Define $Z_t = (X_t, Y_{1:t-1})$. We can show that

- $\blacksquare \mathbb{E}[c(Y_t) + d(X_t, \hat{X}_t) | Z_{1:t}, Y_{1:t}] = \mathbb{E}[c(Y_t) + d(X_t, \hat{X}_t) | Z_t, Y_t]$

Hence, $\{Z_t, t=1,2,\ldots\}$ is a controlled Markov process. Thus, there is no loss of optimality in restricting attention to

$$Y_t = f_t(Z_t) = f_t(X_t, Y_{1:t-1})$$

Structure of optimal policies

■ Structured Policies $(\mathcal{F}^*, \mathcal{G}^*)$

$$\begin{split} \mathcal{F}^{\star} &= \prod_{t=1}^{T} F_{t}^{\star}, \\ F_{t}^{\star} &= \left\{ f_{t} \in F_{t}' : \forall x_{t} \in \mathbb{X}, \, \forall y_{1:t-1} \in \mathbb{Y}, \, f_{t}(x_{t}, y_{1:t-1}) \in \{x_{t}, \mathbb{b}\} \right\} \end{split}$$

Structure of optimal policies

■ Structured Policies $(\mathcal{F}^*, \mathcal{G}^*)$

$$\begin{split} \mathcal{F}^{\star} &= \prod_{t=1}^T F_t^{\star}, \\ F_t^{\star} &= \left\{ f_t \in F_t' : \forall x_t \in \mathbb{X}, \, \forall y_{1:t-1} \in \mathbb{Y}, \, f_t(x_t, y_{1:t-1}) \in \{x_t, \mathbb{b}\} \right\} \\ \text{and} \\ \mathcal{G}^{\star} &= \prod_{t=1}^T G_t^{\star}, \\ G_t^{\star} &= \left\{ g_t \in G_t : \forall y_{1:t-1} \in \mathbb{Y} \text{ and } \forall y_t \in \mathbb{X}, \, g_t(y_{1:t}) = y_t \right\} \end{split}$$

Structure of optimal policies

■ Structured Policies $(\mathcal{F}^*, \mathcal{G}^*)$

$$\mathcal{F}^{\star} = \prod_{t=1}^{T} F_{t}^{\star},$$

$$F_{t}^{\star} = \left\{ f_{t} \in F_{t}' : \forall x_{t} \in \mathbb{X}, \forall y_{1:t-1} \in \mathbb{Y}, f_{t}(x_{t}, y_{1:t-1}) \in \{x_{t}, \mathbb{b}\} \right\}$$

and

$$\begin{split} \mathcal{G}^{\star} &= \prod_{t=1}^{T} G_{t}^{\star}, \\ G_{t}^{\star} &= \left\{ g_{t} \in G_{t} : \forall y_{1:t-1} \in \mathbb{Y} \text{ and } \forall y_{t} \in \mathbb{X}, g_{t}(y_{1:t}) = y_{t} \right\} \end{split}$$

Theorem: There is no loss of optimality in restricting attention to structured policies.

Implication: Real-time coding does not improve performance

Define $(\mathcal{F}^{(s)}, \mathcal{G}^{(s)})$, s = 0, 1, ..., T as follows

$$(F_t^{(s)}, G_t^{(s)}) = \begin{cases} (F_t', G_t) & t < s \\ (F_t^*, G_t^*) & t \ge s \end{cases}$$

Define $(\mathcal{F}^{(s)}, \mathcal{G}^{(s)})$, s = 0, 1, ..., T as follows

$$(F_t^{(s)}, G_t^{(s)}) = \begin{cases} (F_t', G_t) & t < s \\ (F_t^*, G_t^*) & t \ge s \end{cases}$$

Lemma

For any
$$(f^{(s+1)},g^{(s+1)})\in (\mathcal{F}^{(s+1)},\mathcal{G}^{(s+1)})$$
, there is $(f^{(s)},g^{(s)})\in (\mathcal{F}^{(s)},\mathcal{G}^{(s)})$, such that

$$\mathcal{J}(\boldsymbol{f}^{(s)}, \boldsymbol{g}^{(s)}) \leq \mathcal{J}(\boldsymbol{f}^{(s+1)}, \boldsymbol{g}^{(s+1)})$$

Define $(\mathcal{F}^{(s)}, \mathcal{G}^{(s)})$, s = 0, 1, ..., T as follows

$$(F_t^{(s)}, G_t^{(s)}) = \begin{cases} (F_t', G_t) & t < s \\ (F_t^*, G_t^*) & t \ge s \end{cases}$$

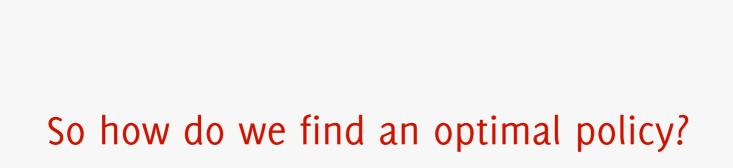

Lemma

For any $(f^{(s+1)}, g^{(s+1)}) \in (\mathcal{F}^{(s+1)}, \mathcal{G}^{(s+1)})$, there is $(f^{(s)}, g^{(s)}) \in (\mathcal{F}^{(s)}, \mathcal{G}^{(s)})$, such that

$$\mathcal{J}(\boldsymbol{f}^{(s)}, \boldsymbol{g}^{(s)}) \leq \mathcal{J}(\boldsymbol{f}^{(s+1)}, \boldsymbol{g}^{(s+1)})$$

 \blacksquare Lemma \Longrightarrow Theorem.

$$(\mathcal{F}^{(T+1)},\mathcal{G}^{(T+1)})=(\mathcal{F}',\mathcal{G}), \qquad (\mathcal{F}^{(0)},\mathcal{G}^{(0)})=(\mathcal{F}^{\star},\mathcal{G}^{\star})$$

Dynamic programming decomposition

Non-classical information structure

$$Y_t = f_t(X_t, Y_{1:t-1})$$
 $\hat{X}_t = g_t(Y_{1:t-1}, Y_t)$
Sensor Estimator

Dynamic programming decomposition

Non-classical information structure

$$Y_t = f_t(X_t, Y_{1:t-1})$$
 $\hat{X}_t = g_t(Y_{1:t-1}, Y_t)$
Sensor Estimator

Belongs to the class of tractable non-classical information structures identified in [Mahajan, Nayyar, Teneketzis, 2008]

Dynamic programming decomposition

Non-classical information structure

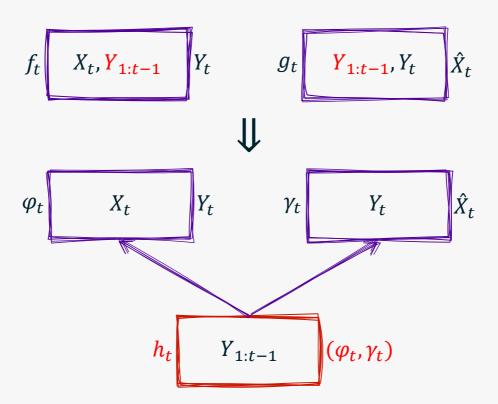

$$Y_t = f_t(X_t, Y_{1:t-1})$$
 $\hat{X}_t = g_t(Y_{1:t-1}, Y_t)$
Sensor Estimator

- Belongs to the class of tractable non-classical information structures identified in [Mahajan, Nayyar, Teneketzis, 2008]
- Look at the problem from the p.o.v. of a coordinator that observes the common data between the sensor and the estimator.
- The local data does not increase with time.

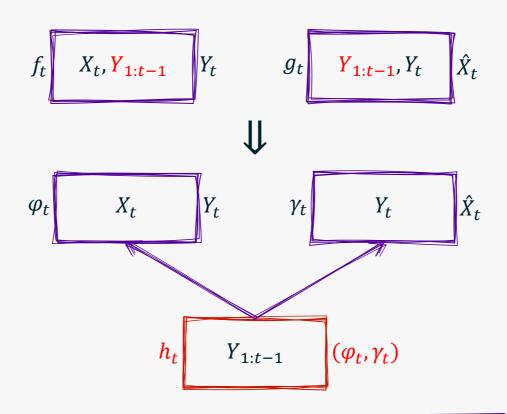

The coordinated system

The coordinated system

The coordinated system

Both systems are equivalent

וו וזע וזע וזע

The coordinated system is a centralized (single agent) POMDP

The coordinated system is a centralized (single agent) POMDP

Structure Result

- Dynamic Program

$$V_t(\pi_t) = \min_{C_t, \hat{X}_t^*} \left\{ \mathbb{E}\left[c(X_t) + d(X_t, \hat{X}_t) + V_{t+1}(\mathsf{update}(\pi_t, Y_t)) \,\middle|\, \pi_t, \varphi_t, \gamma_t\right] \right\}$$

Can be converted to countable state MDP.

Implementation issues

For a fixed transmission policy, $\pi_t \equiv (U_t, N_t)$ where

- $ightharpoonup U_t$ last non-blank transmission
- N time since last non-blank transmission

Implementation issues

For a fixed transmission policy, $\pi_t \equiv (U_t, N_t)$ where

- $ightharpoonup U_t$ last non-blank transmission
- ▶ N time since last non-blank transmission
- Sensor: $Y_t = f_t(X_t, U_t, N_t)$
- Estimator: $\hat{X}_t = g_t(Y_t, U_t, N_t)$

Conclusion

- Use ideas from dynamic team theory and real-time communications
 - remove irrelevant data at sensor
 - coding does not improve performance
 - ▶ DP decomposition by investigating the coordinated system
 - Simplify DP using structure of optimal policy
- Transformed to denumerable MDP with set valued actions

$$V_t(\pi_t) = \min_{C_t, \hat{x}_t^*} \left\{ \mathbb{E}\left[c(X_t) + d(X_t, \hat{X}_t) + V_{t+1}(\mathsf{update}(\pi_t, Y_t)) \,\middle|\, \pi_t, \varphi_t, \gamma_t\right] \right\}$$

Or, equivalently \exists index_t: $\mathbb{X} \mapsto \mathbb{R} \ni C_t = \{x \in \mathbb{X} : \text{index}_t(x) > \tau_t\}$

Why is this talk in the middle of two talks on bandits?

Consider "symmetric" Markov chains and a fixed decoding rule. Finding the optimal transmission policy is tangentially related to [Katehakis and Veinott, 1987] characterization of the Gittin's index as a restart in *i* problem.

Could we reduce the problem to a 1-1/2 armed bandit problem?

Thank you. Questions?
